On

Typhus Fever

—

1
From a consciousness of my incompetency to throw any light upon
on a medical subject, it is with extreme diffidence and reluctance that I
that I act in conformity to one of the prescribed laws of the
institution. Dumb and impotent would it be in me a man
type in medical acquirements (if otherwise circumstanced) to
advance any thing on a subject which has been handled by
men as remarkable for their profound knowledge and acute
as for the superior genius which it has pleased the dispenser
of all things to confer upon them. Neither have I the
benefit which accrues from practice and which is a necessary
to give a right idea concerning all diseases, nor has it
been in my power to peruse with proper attention the
who have written with most ability concerning the diseases
which I have selected for my dissertation. These two objects

requirements for the better performance of my task being deficient
I hope will offer ample apology for the manner in which
it is executed.

125
Dated
Oct 1

The disease I propose treating of is Typhus-fever
and my first object shall be to describe the symptoms & by
then to mention the prognostic & to enumerate the causes and
to give proper directions for the cure of the disease.

Camp, Spottsville, Petted, Hospital, Jail, and Typhus
fever are essentially one and the same disease. Typhus
may be divided into Gravis and Mitis, the former differing
from the latter only in point of violence, requiring a modification
of the same treatment; I shall therefore confine my
remarks to the Typhus Gravis.

In the most part it makes its appearance gradually

but we find exceptions to this rule, It is ushered in by an alternate sensation of heat and cold, pain in the head, back, and catarrhs, considerable prostration of strength and rejection of Spirits, the pulse is small, weak, and frequent, the countenance is pale and sunk, accompanied with confusion in the head, loss of appetite and unrefreshing sleep, white tongue moderate thirst, and nausea. As the fever advances there is great rejection of Spirits, the pain and confusion of the head is more constant, with great nausea & dysphagia, the pulse is not sunk but varies much as to strength and fullness, and is little affected by moderate bleeding the patient is sometimes costive at other times there comes on a Diarrhoea and this variation may be attributed to the different caprices of the patient, The skin is

generally dry and parched, though sweats of unequal abundance frequently occur, and these should not be considered as critical, unless they be gentle, equally diffused and supine towards the decline of the disease; the tongue is now apt to become dry, furrowed, and of a dark brown or red-chalky colour, and if examined minutely will be found to partake more or less of a tremulous motion; the thirst still continues moderate. The Disease advancing the breath becomes remarkably offensive; and there is a black fur deposited on the roots of the teeth, In some patients a Delirium does not make its appearance but what may be more properly denominated Stupor, the faculties of the mind, are generally impaired before death and frequently from the commencement of the disease

this may be produced either by the too early use of stimulants
 or injudicious bleedings. The countenance unless Delirium
 supervenes is significant, the eyes are of a red or yellowish cast
 Delirium increases as night comes on, and if there previously
 existed only a Stupeor, this is apt to change into Delirium
 this particular symptom is induced frequently by copious
 evacuations, or it may be owing to the progress of the fever.
 Whether induced by the one or other cause, during stupor the
 eye lids are half closed, and the patient utters incoherent
 sentences, with a voice scarcely to be heard; as the pulse sinks
 the affection will be found to increase and become more

Subtleties tend, now or a starting of the tendons is also
 a frequent symptom. Petechiae or small spots resembling
 the bites of fleas, make their appearance more particularly

in the back and breast, they are confluent and will often
be locked unless in some situation for these three spots
appear from the transverse arteries in such a way above
the rest of the skin, the skin being very thin and
translucent and bluish of a similar colour.

Though the pain is said to be continued, yet there is
an intermission at a short time and the disease is not
very dangerous, it sometimes spreads the part of the
transverse arteries in the back from the
transverse arteries, but more frequently in the legs of
persons in a very young state there has been instances
of many after the fourth week.

§ *Prurigo*. The form of prurigo is a general
disease which is found in the skin

The first of these symptoms is the slight loss of consciousness
 which is usually accompanied by a sense of vertigo or dizziness
 and a feeling of weakness and fatigue. The patient
 usually complains of a feeling of oppression of the chest, and
 the pulse is frequently found to be a little slower
 and more irregular than usual. It is in these cases a matter of
 the extension of the fingers. The reflex action of
 the eye, however, with a fairly fully formed pupil
 sometimes in the section of the disease gives place
 to a state of so well known as Epistaxis which
 is the only part of the great organ, the nose we possess
 and the source of which is the gastric affection
 consisting of the tendency to inflammation and swelling of
 the capillary vessels of the nasal mucous membrane.

laste whilst the patient is able to walk about; the
second enquires him, and there is some confusion of the
mind; The third is accompanied with great prostration
of strength sinking pulse and stupor. This with diffi-
culty that we distinguish the first stage, but the last
is strongly marked. ~~When~~ Well, in the
1st stage of this fever Combs will be found of infinite
service. Different practitioners have given preference to
different preparations, for instance Dr Ridgce advises the
Antimonial, and Dr Duncan Purgatives, this last I would
prefer from its being a manageable medicine whilst on
the other hand the preparations of Antimony are more
pericious in their effects; Cometic medicines will
be found of most advantage when they purge as well

as moderately vomit the patient. Emetic doses
may frequently arrest the progress of the fever after
the stomach and intestines have been evacuated, and I
fancy it is in this stage of the disease that the use
of the *Eupatorium purgativum*, though not a *quæ* used
highly spoken of. Such medicines relieve the head more certainly
than bloodletting. It is not however always necessary
to commence the cure by Emetics as the Nausea and other
gastric affections may frequently be removed by means
of the effervescent draught or by a weak infusion of
mustard. The milder purges will be found to contri-
bute much towards the well doing of the patient, among
these we may mention particularly the *Oleum tinctum*
Whitart and *Salomæ* or mercury in the form of the

blue, full. Bleeding which the pulse so frequently
indicates in the second stage, is a precarious remedy
the drawing of a small quantity of blood, having but
a momentary effect on the arterial system, whilst larger
bleedings frequently, frustrate the system never to rise
again, and if we consider the buffy coat exhibited by
the drawn blood to justify the repetition of venesection
we shall through its agency inevitably hasten the depar-
ture of our patient. Topical bleeding may be resorted to
when the head is much affected and frequently with benefit
but I believe that, a gentle emetic will more effectively
relieve this symptom (provided circumstances do not contrain-
dicate). In the third stage which is by far the
longest, the pulse is considerably sunk, slow and jerky

improving, but this effluant eruption, is frequently
 absent; much depletion is calculated to produce a direct
 passage from the first to the last stage when we should
 have recourse to Stimulants in large doses frequently repeat-
 ed. Bistorta Alkali may be first mentioned, this medicine
 may be given in substance in doses of 4 or 5 grains every 2
 hours, or in the form of Symp to the extent of a Drachm
 in twenty four hours. Cassia may be given in doses of
 5 or 6 grains every 3 hours, in union with water or milk, or
 in combination with the different barks, as the cortex
Quercinus, Angustura coccinilla, Cornus florida & Magnolia
tripetala, these medicines I would use nearly as auxiliaries
 to the more potent, and in the convalescent stage of Typhus
 this remark I would also extend to the Aristolochia or

Opistorhiza virginiana whose emacinating power on
 many occasions, is immense. *Musk* is an invaluable
 medicine, provided it be genuine and will relieve Delirium
 and Subulter tendinum, and has considerable Diaphoretic
 action given in doses of 6 or 7 grains every two hours; it
 has also the effect of producing the most pleasing and
 refreshing sleep. *Cassia* is similar in its effects to
 musk, and we may expect benefit from its use, given to
 the extent of 15 or 20 grains at a dose; it was the practice
 of Dr. Bridges to combine with it Opium. *Asafetida*
 is particularly serviceable, when expectorants are indicated
 this often happens in the anomalous forms of the disease,
 as in *Suppura cum pneumonia*. *Opium*, The great
 objection to this medicine is that when continued for
 * This medicine is particularly recommended by
 Dr. Pearson.

any length of time, it is apt to produce profuse diaphoresis
 tending much to debilitate and exhaust the patient;
 but in some stages of the disease it is an indispensable
 medicine, as when a Delirium supervenes not dependant
 on an inflammation of the meninges of the brain, the medicine
 then will produce sleep and tranquillise the patient.

Dr Cullen remarks, that in the advanced states of fever
 there is a circumstance occurring, which we may be assured
 of as a fact, though we cannot well explain it, he goes
 on to observe that the cause of fever gives an irritation to
 the brain, which is not of the inflammatory kind, produ-
 cing convulsive motions of the limbs to a considerable degree
 and to this irritation we may impute Delirium and
 subsultus cordium; to remove these effects of irritation.

Blist
to Gue

It is a powerful remedy. Dr. Ferri says it is a
 in coughs and it is the opinion of Dr. Brown that it might
 be used to combat the disease; after the whole
 of which it requires great nicety and judgment in its administration.

Spice is an article of primary importance, in the cure.
 Of these the warmest and most powerful are preferable.
 It should be more or less taken during the 24 hours, either
 in the form of whey or panna, or in combination with aromatics.
 This last combination, will seldom be found necessary.
 Whey and panna should always be made of the best white
 cream. In cases of exigency, we may resort to the use of
 the more powerful drinks, as Rum, Brandy and Porter.

Blisters have been used in every stage of the disease.
 Dr. Cullen used them indiscriminately; Dr. Ferri thinks

the

that they induce subsultus terræ, especially in females if used during the second and third Stages; they are extremely beneficial in typhus even pneumonias, and should be used early: they will be found also to relieve Delirium, especially when aggravated by the use of wine.

Emetics are more useful in the last stage than Bleeds as they do not deplete their action being gradual and at the same time lasting. ian Theriakes. We have the honourable testimony of Dr. Keim in support of the great benefit to be derived from the use of tartar emetic in the case of typhus; we may use it in doses of 15 or 20 drops repeated three or four times a day. Mercury, given so as to produce a gentle Ptyalism, in the first and 2^d part of the 3^d stage is a remedy deserving considerable

attention. The application of cold water to the surface
 of the body under such circumstances is highly efficacious,
 for it diminishes the morbid action of the skin & remarkably
 diminishes the morbid action of the system. Thus applied it
 will relieve in a great measure the morbid heat of the system
 which sometimes may induce sleep. Much has been justly
 ascribed to the use of well conducted applications in
 moderating the violence of the disease.

I should not terminate my notice here as taken on the subject
 of the joints, our chief reliance should be in the use of bark and
 arsenic. Scrophulous which is so frequent an attendant on this
 disease; when in decay should be checked by means of the
 caustics which in preference to spiritus.

The morbid action in affections of the secretory glands is an

extreme

or even them without waiting for a shock, or softening
the humor which probably may not take place at all, owing
to the rigidity of the enclosed pus.

Amongst external applications, we may mention a mixture of
Oils of Turpentine & Liniment of Camphorides; I have witnessed
the good effects of this combination applied generally to the
surface of the body, by means of friction; It was facilitated as
it were the patient respiration & perspiration, and suddenly
restored all the functions of the body.

To promote the action of Diaphoretic medicines we find
a valuable auxiliary in the use of heated salt confined in
bags and bottles filled with warm water applied to the
extremities.
